JOB MARKET PAPER

Substance Use Disorder Treatment and Human Capital: Evidence from At-Risk Youth. (Job Market Paper)

This paper studies the short- and long-run impacts of substance use disorder (SUD) treatment on human capital accumulation and labor market outcomes among at-risk adolescents. Specifically, I study the effect of one of the most common types of SUD treatment programs for adolescents—residential treatment center schools, which provide clinical SUD treatment and have a school on site. Using administrative data that link individual-level records across multiple government agencies in Texas, I examine within-individual changes in outcomes around the time of SUD treatment with a difference-in-differences design. I find that treated students experience declines in chronic absenteeism, disciplinary action, and course failure in the first two years following SUD treatment relative to a matched comparison group. I also find positive long-term impacts on college enrollment by age 20 and employment at ages 17–20. Heterogeneity analysis reveals that the positive impacts of SUD treatment center schools are nearly universal across demographic characteristics. My findings suggest that SUD treatment among adolescents may have lasting consequences and is a promising tool to promote human capital development among at-risk youth.

WORKING PAPERS AND PUBLICATIONS

Trauma at School: The Impacts of Shootings on Students' Human Capital and Economic Outcomes. (with Marika Cabral, Maya Rossin-Slater, Molly Schnell, and Hannes Schwandt) NBER working paper #28311. Revise and Resubmit at the *Review of Economic Studies*.

We examine how shootings at schools—an increasingly common form of gun violence in the United States—impact the educational and economic trajectories of students. Using linked schooling and labor market data in Texas from 1992 to 2018, we compare within-student and across-cohort changes in outcomes following a shooting to those experienced by students at matched control schools. We find that school shootings increase absenteeism and grade repetition; reduce high school graduation, college enrollment, and college completion; and reduce employment and earnings at ages 24–26. We further find school-level increases in the number of leadership staff and reductions in retention among teachers and teaching support staff in the years following a shooting. The adverse impacts of shootings span student characteristics, suggesting that the economic costs of school shootings are universal.

Beyond Opioids: The Effect of Mandatory Access Prescription Drug Monitoring Programs on Non-Opioid Prescribing. (with David Beheshti) SSRN working paper #4098995. *Under Review*.

A growing literature has examined how mandatory access prescription drug monitoring programs (MA PDMPs), laws that require providers to consider a patient's prescription history before prescribing controlled substances, affect opioid-related outcomes. However, little is known about their impact on non-opioid-related outcomes. In this paper, we examine the effect of MA PDMPs on prescribing patterns of stimulants and benzodiazepines. Using a difference-in-differences event study design, we show that MA PDMPs led to decreases in stimulant prescribing. In contrast, we find suggestive evidence that benzodiazepine prescriptions increase following the implementation of a MA PDMP. Our findings highlight that MA PDMPs do have effects on non-opioid drug prescribing, but these effects differ substantially across drug types.

Must-Access Prescription Drug Monitoring Programs and the Opioid Overdose Epidemic: The Unintended Consequences, *Journal of Health Economics*, 75, January 2021.

Although supply-side drug policies that limit access to legal opioids have reduced prescription opioid abuse, growing evidence shows that these policies have had the unintended consequence of increasing use of illegal opioids, including heroin. I add to this literature by studying the consequences of must-access prescription drug monitoring programs (PDMPs), which legally require providers to access a state-level database with a patient's prescription history before prescribing controlled substances under certain circumstances. Using a difference-in-differences specification, I find strong evidence that must-access PDMPs have increased heroin death rates. My estimates indicate that two years after implementation, must-access PDMPs were associated with 0.9 more heroin deaths per 100,000 in a half-year period, relative to control states. Moreover, I find that prescription opioid death rates declined following implementation. My results suggest that even if must-access PDMPs reduce prescription opioid deaths, the decrease is offset by a large increase in illegal opioid deaths.

Dynamics of Adolescents' Life Satisfaction and Effect of Class Rank Percentile: Evidence from Korean Panel Data, *Journal of Economic Psychology*, 59, April 2017. (with Jinook Jeong)

This study investigates the dynamics of adolescents' life satisfaction and the effects of academic success on life satisfaction using the Korean Youth Panel Survey (KYPS) 2003–2007 data. Unlike the previous studies, our dynamic ordered probit models allow for persistence in life satisfaction which is attributable both to unobserved individual heterogeneity and to state dependence. First, we find that strong state dependence exists in adolescents' life satisfaction, that is, current life satisfaction is significantly affected by the previous state. Second, we show that academic success undoubtedly affects adolescents' life satisfaction even after controlling for the state dependence. Finally, we present that there exists an interesting gender difference: boys show stronger persistence in the state of high life satisfaction, whereas girls have stronger persistence in dissatisfaction.
